COMP 474/6741 Intelligent Systems (Winter 2024)

Worksheet #2: Vocabularies & Ontologies

Turtle format with the following prefix definitions and define Student as part of the ex names (ex:Student): @prefix rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns# . @prefix rdfs: http://www.w3.org/2000/01/rdf-schema# . @prefix xsd: http://example.org/ . Add the triple to explicitly define ex:Student as a class within the ex namespace:	Task 1. Quick refresher: Using the N-Triples (N3) serialization format, write an RDF triple describe Concordia's location (city), as recorded in the wikidata.org knowledge graph:			
Turtle format with the following prefix definitions and define Student as part of the ex names (ex:Student): Oprefix rdf: http://www.w3.org/1999/02/22-rdf-syntax-ns# . Oprefix rdfs: http://www.w3.org/2000/01/rdf-schema# . Oprefix xsd: http://example.org/ . Add the triple to explicitly define ex:Student as a class within the ex namespace: and draw the resulting RDF graph: Task 3. Now add another triple stating that Jane (ex:jane) is of type ex:Student: and add it to the graph above. Task 4. It is good practice to give every IRI a human-readable label (where appropriate). Add rdfs:label triples (in English and French) for "Student": 1. 2. (Similarly, you would define an rdfs:comment to explain what it means to be a student.) Task 5. For now at least, every Student is a Person (sorry, robots!). Define this fact as a triple				
<pre>@prefix rdfs: . @prefix xsd: . @prefix ex: . @prefix ex: . @prefix ex: . @Add the triple to explicitly define ex:Student as a class within the ex namespace:</pre>	Turtle format with the following prefix definitions and define Student as part of the ex names

	and add it to the graph above. Task 4. It is good practice to give every IRI a human-readable label (where appropriate). Add rdfs:label triples (in English and French) for "Student": 1. 2. (Similarly, you would define an rdfs:comment to explain what it means to be a student.)			

Construct	Syntactic form	Description
Class (a class)	C rdf:type rdfs:Class	C (a resource) is an RDF class
Property (a class)	Prdf:type rdf:Property	P (a resource) is an RDF property
type (a property)	Irdf:type C	I (a resource) is an instance of ${\bf C}$ (a class)
subClassOf (a property)	C1 rdfs:subClassOf C2	C1 (a class) is a subclass of C2 (a class)
subPropertyOf (a property)	P1 rdfs:subPropertyOf P2	P1 (a property) is a sub-property of P2 (a property)
domain (a property)	P rdfs:domain C	domain of ${\bf P}$ (a property) is ${\bf C}$ (a class)
range (a property)	Prdfs:range C	range of P (a property) is C (a class)

Task 6. Ok, let's look at these three triples (written in pseudocode for brevity):

```
<FG-C080> <teaches> <COMP474/6741> .
cprofessor> <is a> <slide> .
<student> <handed in by> <assignment> .
```

Are these *syntactically* legal triples? (Spoiler alert: yes, we could write each of them using perfectly fine RDF URIs.) So what exactly is wrong here? (Discuss with your worksheet team partner!)

Task 7. We now define a *property*, studiesAt, so that we can indicate at which university a student is studying. Write the triple defining studiesAt as a property (again using the ex: namespace):

(Note: properties should also have labels & comments, but we omit this here.)

Task 8. We now have to add *domain and range restrictions* for our property to avoid problems like the ones in Task 6 above. For the *domain* of our studiesAt property, we only permit ex:Student resources and for the *range*, we only admit ex:University resources. Write the two triples:

- **Task 9.** A widely used vocabulary for describing people and their (social) networks is *Friend-of-a-Friend* (FOAF), which you've seen before:

PREFIX foaf: http://xmlns.com/foaf/0.1/>

- 1. Assume Joe has a photo of him published under http://facebook.me/joe.png (not a real URL). How can you add this information to the knowledge graph using FOAF (hint: look up the vocabulary using the prefix URL above):
- 2. Again using FOAF, model that Jane is 22 years old (use datatype integer for the age):
